Photodynamic therapy has been widely investigated over the past two decades and is emerging as a promising therapeutic modality for skin cancers and several inflammatory diseases. This growing interest is based on the availability of a new simple, effective and safe regimen using the topical application of a pro-drug, 5-aminolevulinic acid, as well as on the development of new "second generation" photosensitizers, namely 5-aminolevulinic acid-esters, phthalocyanines, chlorins, porphycenes and hypericin. In contrast to hematoporphyrin derivatives, these compounds are characterized by short-lasting generalized skin photosensitivity. These dyes are available for either topical or systemic delivery and are well characterized. The basic principles of PDT is more complex than chemotherapy or other pharmacological modalities. PDT involves not only a drug but an otherwise harmless compound that is activated by visible light. The interaction of these two treatment components is PDT. The variability of these both components results in a complexity of the treatment that may disorient the clinician who does not have specific experience in this field. This book aims to focus experimental and clinical findings on PDT in order to attract and direct the attention of a growing number of dermatologists. This text offers the busy dermatologist an up-to-date review of developments in the management and treatment of dermatologic disorders. Dermatologic Therapy in Current Practice explores not only the research theories that have recently emerged, but also the practical application of that research in standard clinical practice. A range of topics is explored, including new drug therapies, surgical advances and the management of certain common skin problems, such as psoriasis, rosacea, skin cancer and acne. This volume is indispensable for every dermatologist, general practitioner and plastic surgeon, and it is useful for advanced students in dermatology. This volume provides an in-depth overview of the current state of psoriasis and its management. It reviews the clinical manifestations of psoriasis as well as psoriatic arthritis and emphasizes the evolving paradigm of therapy. Coverage includes topical and ultraviolet therapies as well as traditional systemic therapy. In addition, a major focus of the volume is on biologic therapies. New agents in development are also reviewed. Photodynamic therapy is a proven effective treatment of actinically damaged skin cells, nonmelanoma skin cancers, and acne and other pilosebaceous conditions. As an agent for general facial rejuvenation it has untapped potential. The current state of PDT therapy and future applications are discussed in detail in this exciting new volume. Throughout, the focus is on evidence-based clinical uses of PDT, including pretreatment regimens, avoidance and management of complications, and posttreatment suggestions.
