Qualified recipients are lawyers and judges, law students, law librarians and associate members of the American Bar Association. Ecosystem-Based Management (EBM) is one of the most holistic approaches to protecting marine and coastal ecosystems as it recognizes the need to protect entire marine ecosystems instead of individual species. After decades of pollution, habitat degradation and overfishing, now climate change and ocean acidification threaten the health of the ocean in unprecedented way. Environmental

Management of Marine Ecosystems illustrates the current status, trends, and effects of climate, natural disturbances and anthropogenic impacts on marine ecosystems. It demonstrates how to integrate different management tools and models in an up-to-date, multidisciplinary approach to environmental management. This indispensable guide provides several case studies from around the world and creates a framework for identifying management tools and their applications in coral reefs, fisheries, migratory species, marine islands and associated ecosystems such as mangroves and sea grass beds. It discusses the physical and chemical compositions of marine ecosystems along with the threats and actions needed to protect them. The application of model framework to several contemporary management issues include the modelling of harmful algal bloom dynamics, understanding the dispersal of sea lice, and the possible impacts on intertidal communities of the provision of novel offshore habitat. The results of extensive research by an international team of contributors, the Environmental Management of Marine Ecosystems is designed to inform scientists, practitioners, academics, government and non-government policymakers on the particularities of marine ecosystems and assist them in understanding the EBM approaches in means of mitigation and adaptation of human activities that result in sustainability. These practices will help change the current methodologies used for resource assessment and the future regulations of marine resources. This book endeavors to break the stereotype that basic electrical machine courses are limited only to transformers, DC brush machines, induction machines, and wound-field synchronous machines. It is intended to serve as a textbook for basic courses on Electrical Machines covering the fundamentals of the electromechanical energy conversion, transformers, classical electrical machines, i.e., DC brush machines, induction machines, wound-field rotor synchronous machines and modern electrical machines, i.e., switched reluctance machines (SRM) and permanent magnet (PM) brushless machines. In addition to academic research and teaching, the author has worked for over 18 years in US high-technology corporative businesses providing solutions to problems such as design, simulation, manufacturing and laboratory testing of large variety of electrical machines for electric traction, energy generation, marine propulsion, and aerospace electric systems. Also included are 35 posters documenting a broad scope of applications of computational intelligence techniques in a variety of areas. The volume addresses all current issues in computational intelligence, e.g. fuzzy logic, fuzzy control, neural networks, evolutionary algorithms, genetic programming, neuro-fuzzy systems, adaptation and learning, machine learning, etc. Für das elektroerosive Abtragverfahren haben sich in den letzten Jahren hauptsächlich transistorgesteuerte Impulsgeneratoren durchgesetzt und die vorherigen Schwingkreisgeneratoren weitgehend abgelöst. Obgleich der schaltungs technische Aufwand weitaus größer ist, überwiegen beim gesteuerten Generator die Vorteile des geringeren Elektrodenverschleißes im Schruppbereich sowie der höheren Abtragleistung. Neben Leistungstransistoren, die vor allem in ihrer maximalen Betriebsspannung auf 60-100 V beschränkt sind aber auch als schaltbaren Maximalstrom nur 10-15 A erreichen, können Thyristoren als gesteuerte Schalter in einem Impuls generator eingesetzt werden. Der Thyristor hat den Vorteil großer schaltbarer Ströme, die heute bis zu 800 A bei 1200 V Sperrspannung betragen. Demgegenüber besteht der Nachteil, daß ein Thyristor nicht wie ein Transistor bei fehlender Aussteuerung sperrt, sondern durch eine Unterbrechung der positiven Anoden spannung für die typische Freiwerdezeit der Zelle gelöscht werden muß. Diese Löschung muß durch eine äußere Beschaltung, den sogenannten Löschkreis, erfolgen. Der Entwurf und die Berechnung eines thyristorgesteuerten Impulsgenerators ist Gegenstand des ersten Teiles dieses Berichtes. Im zweiten Teil werden Entladevorgänge sowie Probleme der Vorschubregelung behandelt. Die Vorschubregelung der Werkzeugelektrode wirft besondere Probleme auf, da einmal der Verstellbereich der Impulsenergien wesentlich erweitert wurde, zum anderen aber auch mit wesentlich höheren Tastverhältnissen, als~ einem erhöhten zeitlichen Materialabtrag, gearbeitet wird.
